Roadmap 2017-06-12

- What is a frontend?
- Other approaches
- What I expect

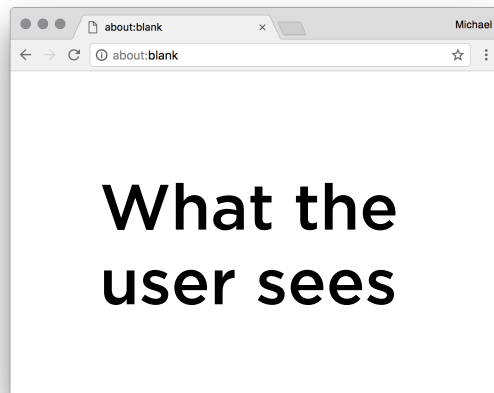

- Introduction
 - React
 - Our pipeline

- Code

- Exercises

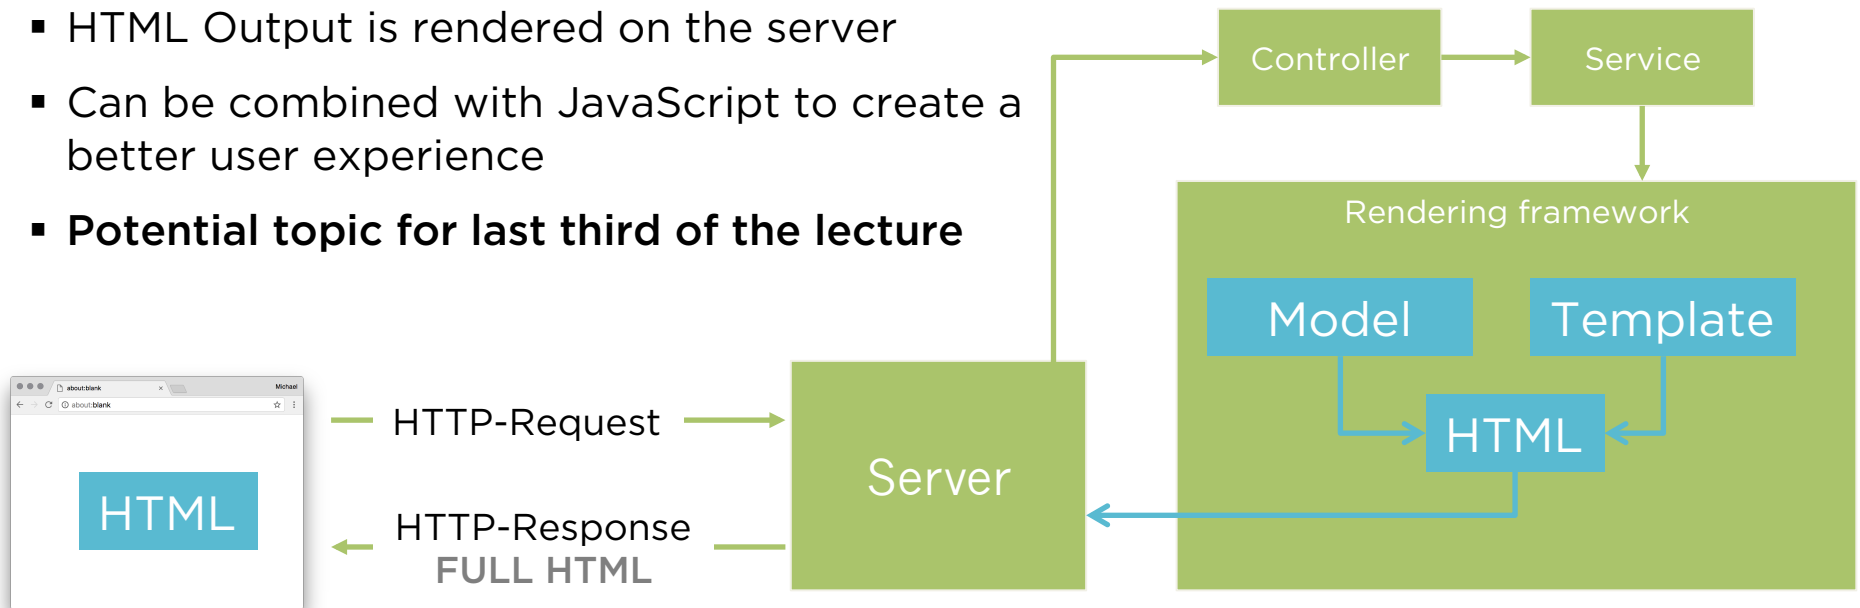

What is a frontend?

- Component of application
- Execution environment Webbrowser
 - HTML
 - CSS
 - JavaScript

Other approaches

- In Java with Spring or JavaEE
- Examples
 - Wicket
 - Thymeleaf and co.
- HTML Output is rendered on the server
- Can be combined with JavaScript to create a better user experience
- **Potential topic for last third of the lecture**

What I expect

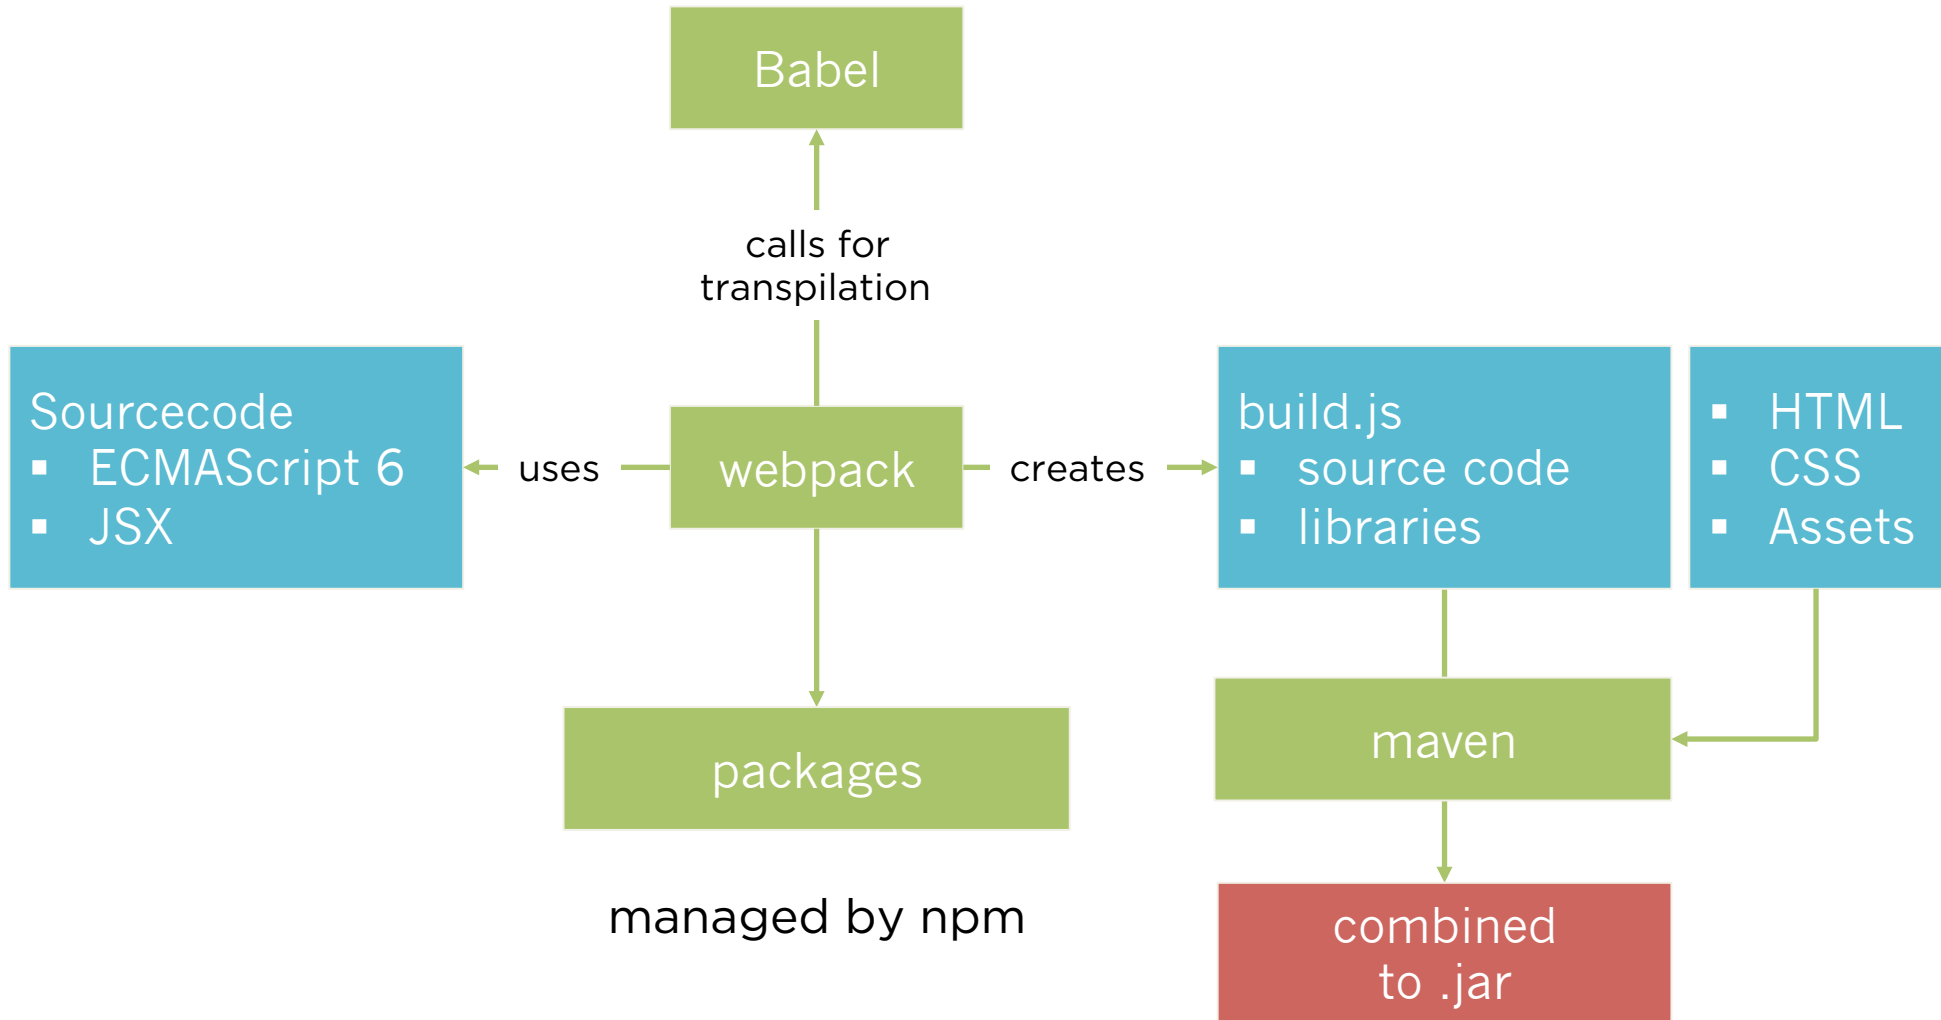

- This lecture is not a language tutorial
- Reading tutorials aloud or showing you introductory topics is boring ;-)
- I expect that you learn additional topics by yourself
- (This is what happens in reality)
- As in Java & Spring, I'm going to show you examples
 - HTML
 - JavaScript
 - CSS

React

- Virtual DOM
- Components
- Handles generating of HTML from data
- Simple support for state
 - Later: redux
- A lot of existing additional libraries
- **JSX**
 - JavaScript syntax extension
 - Write HTML in your JavaScript code
 - Advantages and disadvantages (**as always**)

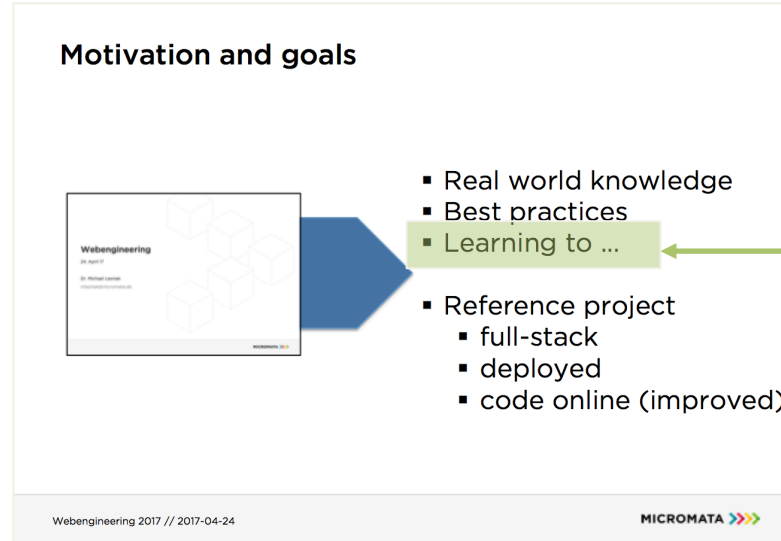

A primer of our pipeline

Exercises

First and foremost

- While researching solutions...
- ...think about your strategy
 - looking around the internet (what terms? why these?)
 - reading tutorials
 - talking to your fellow students – how do you explain your problem
 - What is your alternative strategy when you feel stuck?

This is your job,
I'm simply here to
support you :-P

Functional components

- What is a functional component?
- What is the difference between a functional and a class-based component?
 - Syntactically
 - Semantically
- Modify the greeter example to be a functional component
 - free-form // play-time

Add axios to your project

- What the heck is axios?
- Add it to your project
- How can you test that it works
 - Think about the simplest approach
 - When testing and playing around with libraries, quick and dirty is ok
 - ...but do not forget to clean up afterwards ;-)

Play around with axios

- Use axios to
 - create a new post
 - retrieve the list of posts
- Since we are still playing around, think again about the simplest way possible

Posts

- Create a component to show the list of existing posts
- Remove the example code
- Add your component

The fun begins :-)
